

# TEXAS WATER RECYCLING FACILITIES

## BUILDING PERMITS

Building Permits are those required for the planning and construction of the water recycling facility. Like with any other facility, a number of permits will have to be obtained at the state, county, and city levels to approve of the construction. However, because these permits are not unique to the process of building a water recycling facility, they fall outside the scope of this research. Municipalities should consult with local building and construction experts to better understand what is required to construct the facility.

## FEDERAL CONSIDERATIONS

There are currently no federal permits for the operation of water recycling facilities in Texas. The Clean Water Act authorizes the delegation of federal standards to the Texas Commission on Environmental Quality.

## STATE CONSIDERATIONS

Like with any other facility, a number of permits will have to be obtained at the state level to approve of the construction. However, because these permits are not unique to the process of building a water recycling facility, they fall outside the scope of this research. Municipalities should consult with local building and construction experts to better understand what is required to construct the facility.

## LOCAL CONSIDERATIONS

Like with any other facility, a number of permits will have to be obtained at the county, and city levels to approve of the construction. However, because these permits are not unique to the process of building a water recycling facility, they fall outside the scope of this research. Municipalities should consult with local building and construction experts to better understand what is required to construct the facility.
